

Supply line for raw water, Laholmsbukstens VA

WATER SUPPLY

The Municipality of Halmstad, in Sweden, sources its drinking water from ground water, and actions were taken to prepare for possible problems that could arise due to low ground water levels.

The situation had to be solved quickly to prevent a possible crisis. The plan was to pump raw water from a new source to a new water treatment facility.

Alvenius was contracted to deliver 3 600 m of FlowMax pipe system. Everything was coated with CorroFlo and RocShield for maximum anti-corrosion protection and to minimise the risk of external damage. This highly efficient anti-corrosion protection ensures the pipe system is extremely durable.

The complete system was installed quickly and easily by two installers without any needs for machinery or advanced tools - all they needed were socket wrenches.

The entire system was installed in less than three weeks.
